1. Project Overview & Objective

The primary objective of this project is to import external employee records from a spreadsheet into the ServiceNow platform using Data Sources and Import Sets into a staging table, and map the data accurately into a custom target table (u_employee_test) using **Table Transform Maps** without data loss. Following the successful data load, an interactive analytical dashboard with multiple report visualizations was configured to validate and analyze the dataset.

2. Milestone 1 & 2: Table Transform Map Configuration

Description: A Table Transform Map was defined to handle the schema transformation and data flow from the staging import set table (u_employee_import) to the target production table (u_employee_test).

The screenshot shows the ServiceNow configuration page for a Table Transform Map named 'Sample Spreadsheet Import'. The page is titled 'Table Transform Map - Sample Spreadsheet Import' and includes a search bar and navigation links. The configuration details are as follows:

- Name:** Sample Spreadsheet Import
- Source table:** Employee Import [u_employee_im...]
- Active:** ☒
- Run business rules:** ☒
- Enforce mandatory fields:** No
- Copy empty fields:** ☐
- Create new record on empty coalesce fields:** ☐
- Application:** Global
- Created:** 2026-09-28 06:32:00
- Target table:** Employee Test [u_employee_test]
- Order:** 100
- Run script:** ☐

Below the configuration fields, there are buttons for 'Copy', 'Update', and 'Delete'. A 'Related Links' section includes links for 'Auto Map Matching Fields', 'Mapping Assist', 'Validate Coalesce Fields', 'Transform', 'Index Coalesce Fields', and 'Run Point Scan'. At the bottom, a status bar shows 'Field Maps (5)', 'Transform Scripts', and 'Unused coalesce fields for emotv values (1)'.

- **Transform Map Name:** Sample Spreadsheet Import
- **Source Table:** Employee Import (u_employee_import)
- **Target Table:** Employee Test (u_employee_test)
- **Application:** Global
- **Order:** 100
- **Run Business Rules:** Active (true)

3. Milestone 3: Field Mapping & Coalesce Validation

Description: Source sheet headers were mapped one-to-one with the corresponding columns in the target table. To prevent duplicate record creation and ensure data integrity upon re-import, the Employee ID attribute was established as the primary matching key (Coalesce = true).

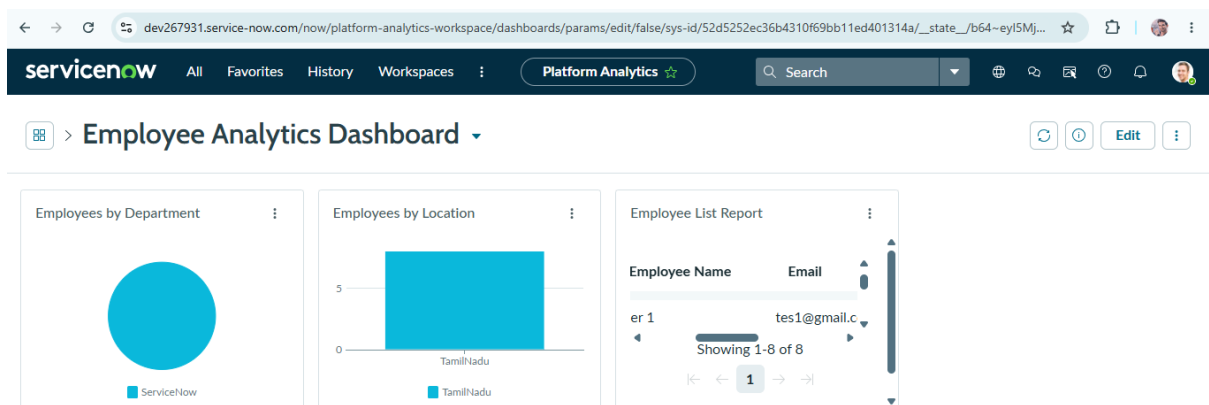

Source field	Target field	Coalesce
u_email	u_email	false
u_name	u_employee_name	false
u_location	u_location	false
u_department	u_department	false
u_employee_id	u_employee_id	true

Source Field	Target Field	Coalesce
u_employee_id	u_employee_id	true
u_name	u_employee_name	false
u_email	u_email	false
u_department	u_department	false
u_location	u_location	false

4. Milestone 4: Data Validation & Table Records List

Description: After running the transformation process, the target table was verified to confirm that all records were imported accurately with their corresponding attributes populated.

- **Employee List Report (Data Table View):** Displays the complete listing of active employee records.
- **Employees by Department (Donut Chart):** Visualizes the categorical distribution of employees grouped by department.
- **Employees by Location (Horizontal Bar Chart):** Represents headcounts categorized across distinct locations.

6. Conclusion

The implementation successfully demonstrates external data ingestion, automated schema mapping, duplicate prevention through coalesce configuration, and operational business intelligence reporting via dynamic ServiceNow dashboards.
